OSPF (Open Shortest Path First)

- “Open”: specification publicly available
  - RFC 1247, RFC 2328
  - Working group formed in 1988
- Goals:
  - Large, heterogeneous internetworks
- Uses the Link State algorithm
  - Topology map at each node
  - Route computation using Dijkstra’s algorithm

OSPF “Advanced” Features (not in RIP)

- **Security**: All OSPF messages are authenticated (to prevent malicious intrusion); UDP used
- **Multiple** same-cost paths allowed (only one path in RIP)
- For each link, multiple cost metrics for different TOS (e.g., satellite link cost set “low” for best effort; high for real time)
- Integrated **uni-** and **multicast** support:
  - Multicast OSPF (MOSPF) uses same topology database as OSPF
- **Hierarchical** OSPF in large domains.
**OSPFv2: Components**

- Hello Protocol: “Who is my neighbor?”
- Designated router/Backup designated router (DR/BDR) election: “With whom I want to talk?”
- Database Synch: “What info am I missing?”
- Reliable flooding alg: “How do I distribute info?”
- Route computation
  - From link state database
  - Using Dijkstra’s algorithm
  - Supporting equal-cost path routing

**Neighbor Discovery and Maintenance**

- Hello Protocol
  - Ensures that neighbors can send packets to and receive packets from the other side: bi-directional communication
  - Ensures that neighbors agree on parameters (HelloInterval and RouterDeadInterval)
- How
  - Hello packet to fixed well-known multicast address
  - Periodic Hellos
  - Broadcast network: Electing designated router
Some Multicast Addresses

- 224.0.0.5 AllSPFRouters OSPF- ALL. MCAST. NET
- 224.0.0.6 AllDRouters OSPF- DSIG. MCAST. NET

- FF02:: 5 and FF02:: 6, respectively for OSPFv3.

- While we are at it:
  - 224.0.0.1 ALL- SYSTEMS. MCAST. NET
  - 224.0.0.2 ALL- ROUTERS. MCAST. NET
  - 224.0.0.9 RIP2- ROUTERS. MCAST. NET
  - 224.0.0.10 IGRP- ROUTERS. MCAST. NET
  - Look up some more (with dig –x address).

Hello Protocol: 3 Phases

- Down
  - Neighbor is supposed to be “dead”
  - No communication at all

- Init
  - “I have heard of a Neighbor”
  - Uni-directional communication

- ExStart or TwoWay
  - Communication is bi-directional
Hello Protocol: Packet

- Hello Interval: 10 seconds (typical default)
- RouterDeadInterval: 4 * Hello Interval (typical default)

OSPF Packet

- IP Protocol #89
- Directly to neighbors using Multicast address
  - TTL 1
- Five packet types
  - Hello
  - Database Description
  - Link State Request
  - Link State Update
  - Link State Acknowledgement
Link State Database

- Based on link-state technology
  - Local view of topology in a database
- Database
  - Consists of Link State Advertisements (LSA)
  - LSA: data unit describing local state of a network/router)
  - Must kept synchronized to react to routing failures

Example Network
## Link State Database: Example

<table>
<thead>
<tr>
<th>LS-Type</th>
<th>Link State ID</th>
<th>Adv. Router</th>
<th>Checksum</th>
<th>Seq. No.</th>
<th>Age</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router-LSA</td>
<td>10.1.1.1</td>
<td>10.1.1.1</td>
<td>0x9b47</td>
<td>0x80000006</td>
<td>0</td>
</tr>
<tr>
<td>Router-LSA</td>
<td>10.1.1.2</td>
<td>10.1.1.2</td>
<td>0x219e</td>
<td>0x80000007</td>
<td>1618</td>
</tr>
<tr>
<td>Router-LSA</td>
<td>10.1.1.3</td>
<td>10.1.1.3</td>
<td>0x65b3</td>
<td>0x80000003</td>
<td>1712</td>
</tr>
<tr>
<td>Router-LSA</td>
<td>10.1.1.4</td>
<td>10.1.1.4</td>
<td>0xe39a</td>
<td>0x8000003a</td>
<td>20</td>
</tr>
<tr>
<td>Router-LSA</td>
<td>10.1.1.5</td>
<td>10.1.1.5</td>
<td>0xd2a6</td>
<td>0x80000038</td>
<td>18</td>
</tr>
<tr>
<td>Router-LSA</td>
<td>10.1.1.6</td>
<td>10.1.1.6</td>
<td>0x05c3</td>
<td>0x80000005</td>
<td>1680</td>
</tr>
</tbody>
</table>

### LSAs

- Consists of a Header and a Body
- Header size is 20 Byte and consists of

<table>
<thead>
<tr>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
</tr>
<tr>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>5</td>
<td>6</td>
<td>7</td>
<td>8</td>
</tr>
<tr>
<td>9</td>
<td>0</td>
<td>1</td>
<td>2</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>LS Age</th>
<th>Options</th>
<th>LS Type</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Link State ID</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Advertising Router</td>
</tr>
<tr>
<td></td>
<td></td>
<td>LS sequence number</td>
</tr>
<tr>
<td></td>
<td>LS Checksum</td>
<td>Length</td>
</tr>
</tbody>
</table>
**LSAs (2.)**

- **Identifying LSAs**
  - LS Type Field
  - Link State ID Field
  - Advertising Router Field
- **Verifying LSA Contents**
  - LS Checksum Field
- **Identifying LSA Instances**
  (keeping in mind that the topology changes)
  - LS Sequence Number Field
    - Linear sequence space
    - Max Seq $\Rightarrow$ new instance

**LSAs (3.)**

- **LS Age Field**
  (to ensure consistency)
  - Goal: new sequence number every 30 minutes
  - Maximum value 1 hour
  - Age $> 1$ hour $\Rightarrow$ invalid $\Rightarrow$ removal
  - Enables premature aging
  - Ensures removal of outdated information
**Example LSA: Router-LSA**

<table>
<thead>
<tr>
<th>LS Age</th>
<th>Options</th>
<th>LS Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Link State ID</th>
<th>Advertising Router</th>
<th>LS sequence number</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>LS Checksum</th>
<th>Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td># Link</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Link ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link Data</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th># TOS</th>
<th>Metric</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Example: Router LSA**

- **Link-Cost**: integers (configured)

```
<table>
<thead>
<tr>
<th></th>
<th>Alter = 0</th>
<th>Optionen</th>
<th>Typ = 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link State ID</td>
<td>10.1.1.1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Advertising Router</td>
<td>10.1.1.1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Sequence Number</td>
<td>0x80000006</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Checksum</td>
<td>0x9b47</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Length</td>
<td>60</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Number of Links</td>
<td>3</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th></th>
<th>8</th>
<th>8</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link ID</td>
<td>10.1.1.2</td>
<td></td>
</tr>
<tr>
<td>Link Data</td>
<td>Interf. Index 1</td>
<td></td>
</tr>
<tr>
<td>Link Typ</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td># TOS</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>Link-Cost</td>
<td>3</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th></th>
<th>8</th>
<th>8</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link ID</td>
<td>10.1.1.3</td>
<td></td>
</tr>
<tr>
<td>Link Data</td>
<td>Interf. Index 2</td>
<td></td>
</tr>
<tr>
<td>Link Typ</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td># TOS</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>Link-Cost</td>
<td>5</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th></th>
<th>8</th>
<th>8</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link ID</td>
<td>10.1.1.1</td>
<td></td>
</tr>
<tr>
<td>Link Data</td>
<td>255.255.255.255</td>
<td></td>
</tr>
<tr>
<td>Link Typ</td>
<td>3</td>
<td></td>
</tr>
<tr>
<td># TOS</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>Link-Cost</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>
```

- Link Typ 1: Peer-to-peer
- Link Typ 3: Stub Network
Link-State Database (2.)

- Is the database synchronized?
  - Same number of LSAs?
  - Sums of LSA LS Checksums are equal?

Database Synchronization

- Central aspect: all routers need to have identical databases!
- 2 types of synchronization
  - Initial synchronization
    - After hello
  - Continuous synchronization
    - Flooding
Initial Synchronization

- Explicit transfer of the database upon establishment of neighbor ship
- Once bi-directional communication exists
- Send all LS header from database to neighbor
  - OSPF database description packets (DD pkt)
  - Flood all future LSA’s

Initial Synchronization (2.)

- Database description (DD) exchange
  - Only one DD at a time
  - Wait for Ack
- Control of DD exchange
  - Determine Master/Slave for DD exchange
  - Determine which LSA’s are missing in own DB
  - Request those via link state request packets
  - Neighbor sends these in link state update packets
- Result:
  - Fully adjacent OSPF neighbors
Example: Database Synchronization

**Example: Database Synchronization**

**OSPF Hello**

- OSPF Hello: I heard 10.1.1.6

**Database Description**:

- Sequence = x
- DD: Sequence = x, 5 LSA Headers:
  - (router-LSA, 10.1.1.1, 0x80000004),
  - (router-LSA, 10.1.1.2, 0x80000007),
  - (router-LSA, 10.1.1.3, 0x80000003),
  - (router-LSA, 10.1.1.4, 0x80000003b),
  - (router-LSA, 10.1.1.5, 0x800000039),
  - (router-LSA, 10.1.1.6, 0x800000005)

- DD: Sequence = x+1, 1 LSA Header:
  - (router-LSA, 10.1.1.6, 0x800000001)

- DD: Sequence = x+1

- Router from previous example are synchronized
- 10.1.1.6 is restarted

Reliable Flooding

- 10.1.1.3 sends LS Update
- Same copy of an LSA is an implicit Ack
- Use delayed Acks
- All LSAs must be acknowledged either implicit or explicit
Robustness of Flooding

- More robust than a spanning tree
- LSA refreshes every 30 minutes
- LSAs have checksums
- LSAs are aged
- LSAs cannot be send at arbitrary rate: there are timers

OSPF LSA Timers

- MinLSArrival 1 second
- MinLSInterval 5 seconds
- CheckAge 5 minutes
- MaxAgeDiff 15 minutes
- LSRefreshTime 30 minutes
- MaxAge 1 hour
Calculation of routing table

- Link state database is a directed graph with costs for each link
- Dijkstra’s SPF algorithms
  - Add all routers to shortest-path-tree
  - Add all neighbors to candidate list
  - Add routers with the smallest cost to tree
  - Add neighbors of this router to candidate list
    - If not yet on it
    - If cost smaller
  - Continue until candidate list empty

Example

```
10.1.1.1 10.1.1.4 10.1.1.2
10.1.1.3 10.1.1.6
10.1.1.5
```

```
10.1.1.1 (5, 10.1.1.1)
10.1.1.2 (3, 10.1.1.2)
10.1.1.3 (10, 10.1.1.5)
10.1.1.4 (5, 10.1.1.1)
10.1.1.5 (11, 10.1.1.5)
10.1.1.6 (10, 10.1.1.5/2)
```
**Network Types**

- So far only point-to-point
- Many other technologies
- Specific requirements for OSPF
  - Neighbor relations
  - Synchronization
  - Representation in DB
- Kinds
  - Point-to-point
  - Broadcast
  - Nonbroadcast multiaccess
  - Point-to-multipoint

**Adjacencies on Broadcast Networks**

- If $n$ routers are on a broadcast link, $n(n-1)/2$ adjacencies can be formed.
Adjacencies (2.)

- If routers formed pair wise adjacencies:
  - Each would originate \((n-1)+1=n\) LSAs for the link.
  - Out of the network, \(n^2\) LSAs would be emanating.
- Routers also send received LSAs to their neighbors
  - \((n-1)\) copies of each LSA present on the network
  - Even with multicast: \((n-1)\) responses
- Solution: elect Designated Router (DR)
  - Routers form adjacencies only with DR:
    - Link acts as a (multi-interface) virtual router to the rest of the area

Designated Router Election

- When router joins:
  - Listen to hellos; if DR and BDR advertised, accept them
    - All Hello packets agree on who the DR and BDR are
    - Status quo is not disturbed
- If there is no elected BDR, router with highest priority becomes BDR
- Ties are broken by highest RouterID
  - RouterIDs are unique (IP address of interface)
- If there is no DR, BDR is promoted to DR
- Elect new BDR
Network LSA’s

- A network LSA represents a broadcast subnet
- Router LSA's have links to network LSA
- Reduction of links
- DR responsible for network LSA
- Link State ID = IP-address of DR

Hierarchical OSPF
Hierarchical OSPF

- Two-level hierarchy: local area and backbone.
  - Link-state advertisements do not leave respective areas.
  - Nodes in each area have detailed area topology; they only know direction (shortest path) to networks in other areas.
- Area Border routers: “summarize” distances to networks in the area and advertise them to other Area Border routers.
- Backbone routers: run an OSPF routing algorithm limited to the backbone.
- Boundary routers: connect to other ASs.

Areas

- An AS (or Routing Domain) is divided into areas.
- Group of routers
- “Close” to each other.
- Reduce the extend of LSA flooding
- Intra-area traffic
- Inter-area traffic
- External traffic: injected from a different AS
- OSPF requires a backbone area (Area 0)
  - Routing between areas only via backbone area
  - Strict area hierarchy (no loops allowed)
**Area Partitions**

- Link and router failures can cause areas to be partitioned
- Some partitions are healed automatically
- Some need manual intervention.
  - Virtual Links.
- Isolated area: link failure results in no path to the rest of the network
  - Obviously, cannot be healed at all.
  - Redundancy is important!

**OSPF: Summary**

- Neighbors
  - Discovery | Multicast group
  - Maintenance | Hello protocol

- Database
  - Granularity | Link state advertisements (LSA)
  - Maintenance | LSA-updates
  - Synchronization | flooding protocol
  - Synchronization protocol

- Routing table
  - Metric | Fixed values
  - Calculation | Local shortest path calculation
